Analysis and comment

Health education
What social marketing can do for you

Getting patients to adopt healthier behaviour can feel like an uphill struggle. One way to improve your success may be to use commercial strategies for influencing consumers. W Douglas Evans looks at the evolution of social marketing in health care while Gerard Hastings and Laura McDermott examine strategies in practice.

How social marketing works in health care
W Douglas Evans

Social marketing applies commercial marketing strategies to promote public health. Social marketing is effective on a population level, and healthcare providers can contribute to its effectiveness.

What is social marketing?
In the preface to *Marketing Social Change*, Andreasen defines social marketing as "the application of proven concepts and techniques drawn from the commercial sector to promote changes in diverse socially important behaviors such as drug use, smoking, sexual behavior . . . This marketing approach has an immense potential to affect major social problems if we can only learn how to harness its power." By "proven techniques" Andreasen meant methods drawn from behavioural theory, persuasion psychology, and marketing science with regard to health behaviour, human reactions to messages and message delivery, and the "marketing mix" or "four Ps" of marketing (place, price, product, and promotion).

These methods include using behavioural theory to influence behaviour that affects health; assessing factors that underlie the receptivity of audiences to messages, such as the credibility and likeability of the argument; and strategic marketing of messages that aim to change the behaviour of target audiences using the four Ps.

How is social marketing applied to health?
Social marketing is widely used to influence health behaviour. Social marketers use a wide range of health communication strategies based on mass media; they also use mediated (for example, through a healthcare provider), interpersonal, and other modes of communication; and marketing methods such as message placement (for example, in clinics), promotion, dissemination, and community level outreach. Social marketing encompasses all of these strategies.
outcomes (such as improved diet or not smoking); and refining the materials for future communications. The last stage feeds back into the first to create a continuous loop of planning, implementation, and improvement.

**Audience segmentation**

One of the key decisions in social marketing that guides the planning of most health communications is whether to deliver messages to a general audience or whether to “segment” into target audiences. Audience segmentation is usually based on sociodemographic, cultural, and behavioural characteristics that may be associated with the intended behaviour change. For example, the National Cancer Institute’s “five a day for better health” campaign developed specific messages aimed at Hispanic people, because national data indicate that they eat fewer fruits and vegetables and may have cultural reasons that discourage them from eating locally available produce.

The broadest approach to audience segmentation is targeted communications, in which information about population groups is used to prepare messages that draw attention to a generic message but are targeted using a person’s name (for example, marketing by mass mail). This form of segmentation is used commercially to aim products at specific customer profiles (for example, upper middle income women who have children and live in suburban areas). It has been used effectively in health promotion to develop socially desirable images and prevention messages (fig 2).

“Tailored” communications are a more specific, individualised form of segmentation. Tailoring can generate highly customised messages on a large scale. Over the past 10-15 years, tailored health communications have been used widely for public health issues. Such communications have been defined as “any combination of information and behavior change strategies intended to reach one specific person, based on characteristics that are unique to that person, related to the outcome of interest, and derived from an individual assessment.”

Because tailored materials consider specific cognitive and behavioural patterns as well as individual demographic characteristics, they are more precise than targeted materials but are more limited in population reach and may be more expensive to develop and implement.

**Media trends and adapting commercial marketing**

As digital sources of health information continue to proliferate, people with low income and low education will find it more difficult to access health information. This “digital divide” affects a large proportion of people in the United States and other Western nations. Thus, creating effective health messages and rapidly identifying and adapting them to appropriate audiences (which are themselves rapidly changing) is essential to achieving the Healthy People 2010 goal of reducing health disparity within the US population.

In response, social marketers have adapted commercial marketing for health purposes. Social marketing now uses commercial marketing techniques—such as analysing target audiences, identifying the objectives of targeted behaviour changes, tailoring messages, and adapting strategies like branding—to promote the adoption and maintenance of health behaviours. Key trends include the recognition that messages on health behaviour vary along a continuum from prevention to promotion and maintenance, as reflected by theories such as the “transtheoretical model”14; the need for unified message strategies and methods of measuring reactions and outcomes15; and competition between health messages and messages that promote unhealthy behaviour from product marketers and others.16

**Prevention versus promotion**

Social marketing messages can aim to prevent risky health behaviour through education or the promotion of behavioural alternatives. Early anti-drug messages in the US sought to prevent, whereas the antismoking campaigns of the US Centers for Disease Control and Prevention and the American Legacy Foundation offered socially desirable lifestyle alternatives (be “cool” by not smoking).17 The challenge for social marketing is how best to compete against product advertisers with bigger budgets and more ways to reach consumers.

**Competing for attention**

Social marketing aimed at changing health behaviour encounters external and internal competition. Digital communications proffer countless unhealthy eating messages along with seductive lifestyle images associated with cigarette brands. Cable television, the web, and video games offer endless opportunities for comorbid behaviour. At the same time, product marketers add to the confusion by marketing “reduced risk” cigarettes or obscure benefits of foods (such as low salt content in foods high in saturated fat).

**How is social marketing used to change health behaviour?**

Social marketing uses behavioural, persuasion, and exposure theories to target changes in health risk behaviour. Social cognitive theory based on response consequences (of individual behaviour), observational learning, and behavioural modelling is widely used.14 Persuasion theory indicates that people must engage in message “elaboration” (developing favourable thoughts about a message’s arguments) for long term persuasion to occur.1 Exposure theorists study how the intensity of and length of exposure to a message affects behaviour.18

Social marketers use theory to identify behavioural determinants that can be modified. For example, social marketing aimed at obesity might use behavioural
theory to identify connections between behavioural determinants of poor nutrition, such as eating habits within the family, availability of food with high calorie and low nutrient density (junk food) in the community, and the glamorisation of fast food in advertising. Social marketers use such factors to construct conceptual frameworks that model complex pathways from messages to changes in behaviour (fig 3).

In applying theory based conceptual models, social marketers again use commercial marketing strategies based on the marketing mix. For example, they develop brands on the basis of health behaviour and lifestyles, as commercial marketers would with products. Targeted and tailored message strategies have been used in antismoking campaigns to build “brand equity”—a set of attributes that a consumer has for a product, service, or (in the case health campaigns) set of behaviours. Brands underlying the VERB campaign (which encourages young people to be physically active) and Truth campaigns were based on alternative healthy behaviours, marketed using socially appealing images that portrayed healthy lifestyles as preferable to junk food or fast food and cigarettes.14 15

Can social marketing change health behaviour?

The best evidence that social marketing is effective comes from studies of mass communication campaigns. The lessons learned from these campaigns can be applied to other modes of communication, such as communication mediated by healthcare providers and interpersonal communication (for example, mass nutrition messages can be used in interactions between doctors and patients).

Social marketing campaigns can change health behaviour and behavioural mediators, but the effects are often small.16 For example, antismoking campaigns, such as the American Legacy Foundation’s Truth campaign, can reduce the number of people who start smoking and progress to established smoking.17 From 1999 to 2002, the prevalence of smoking in young people in the US decreased from 25.3% to 18%, and the Truth campaign was responsible for about 22% of that decrease.18

This is a small effect by clinical standards, but it shows that social marketing can have a big impact at the population level. For example, if the number of young people in the US was 40 million, 10.1 million would have smoked in 1999, and this would be reduced to 7.2 million by 2002. In this example, the Truth campaign would be responsible for nearly 640 000 young people not starting to smoke; this would result in millions of added life years and reductions in healthcare costs and other social costs.

In a study of 48 social marketing campaigns in the US based on the mass media, the average campaign accounted for about 9% of the favourable changes in health risk behaviour, but the results were variable.19 “Non-coercive” campaigns (those that simply delivered health information) accounted for about 5% of the observed variation.20 A study of 17 recent European health campaigns on a range of topics including promotion of testing for HIV, admissions for myocardial infarction, immunisations, and cancer screening also found small but positive effects.18 This study showed that behaviours that need to be changed once or only a few times are easier to promote than those that must be repeated and maintained over time.20 Some examples (such as breast feeding, taking vitamin A supplements, and switching to skimmed milk) have shown greater effect sizes, and they seem to have higher rates of success.18 20

Implications for healthcare practitioners

This brief overview indicates that social marketing practices can be useful in healthcare practice. Firstly, during social marketing campaigns, such as antismoking campaigns, practitioners should reinforce media messages through brief counselling. Secondly, practitioners can make a valuable contribution by providing another communication channel to reach the target audience. Finally, because practitioners are a trusted source of health information, their reinforcement of social marketing messages adds value beyond the effects of mass communication.

Contributors and sources: WDE’s research focuses on behaviour change and public education intervention programmes designed to communicate science based information. He has published extensively on the influence of the media on health behaviour, including the effects of social marketing on changes in behaviour. This article arose from his presentation at and discussions after a recent conference on diet and communication. Competing interests: None declared.

Summary points

Social marketing uses commercial marketing strategies such as audience segmentation and branding to change health behaviour

Social marketing is an effective way to change health behaviour in many areas of health risk

Doctors can reinforce these messages during their direct and indirect contact with patients

Fig 3 Example of social marketing conceptual framework

Putting social marketing into practice

Gerard Hastings, Laura McDermott

Social marketing is acquiring a familiar ring to people in the health sector. The UK government’s recent public health white paper talks of the “power of social marketing” and “marketing tools applied to social good [being] used to build public awareness and change behaviour.” This has led to the formation of the National Social Marketing Centre for Excellence, a collaboration between the Department of Health and the National Consumer Council. The centre will develop the first social marketing strategy for health in England. Similarly, the Scottish Executive recently commissioned an investigation into how social marketing can be used to guide health improvement. Australia, New Zealand, Canada, and the United States all have social marketing facilities embedded high within their health services. Evans has outlined social marketing’s basic precepts.7 We develop some of these ideas and suggest how social marketing can help doctors and other health professionals to do their jobs more effectively.

An old enemy and a new friend

Marketing has long been a force to be reckoned with in public health. In the hands of the tobacco, alcohol, and food industries it has had a well documented effect on our behaviour.14 In the case of tobacco companies this has culminated in extensive controls being placed on their marketing activities. Social marketing argues that we can borrow marketing ideas to promote healthy behaviour. If marketing can encourage us to buy a Ferrari, it can persuade us to drive it safely.

Marketing is based on a simple and unobtrusive idea: putting the consumer and the stakeholder at the heart of the business process. Whereas Henry Ford focused on selling what he could produce—any colour you want as long as it’s black—modern marketers invert this rubric and produce what they can sell. This deceptively simple change has revolutionised commerce over the past 50 years, making Nike and Coca-Cola the behemoths they are. It has succeeded because, paradoxically, listening to consumers and taking care to understand their point of view makes it easier to influence their behaviour.

Social marketers argue that attempts to influence health behaviour should also start from an understanding of the people we want to do the changing. The task is to work out why they do what they do at present—their values and motivations—and use these to encourage healthy options.

Often the picture is much more complex than ignorance of the public health facts. Most people know, for instance, that smoking is dangerous or how their health will improve by quitting. That many people who smoke nevertheless continue to smoke indicates that marketing can play a part in influencing their health decisions.

In the case of tobacco companies, a meta-analysis of the impact of family planning campaigns conducted by the Johns Hopkins Bloomberg School of Public Health/Center for Communication Programs. Presented at the International Communication Association annual meeting, San Diego, May 2003.

International Labour Office (ILO) and the Surgical Instruments Manufacturers Association of Pakistan (SIMAP) is currently in its second phase. Its purpose is to monitor child labour in the sector and withdraw employers who refuse to buy instruments unless they can be certified as not having been produced with child labour.14; but such moves may reduce trade with the manufacturing countries, only compounding the underlying problems of poverty. The solution lies in purchasers insisting on fair and ethical trade when sourcing instruments. Pressure must be applied to suppliers in the developed world to be transparent about where their instruments have been manufactured and for them to ensure that the labourers have been paid a fair wage for their work and that basic international labour and health and safety standards have been followed, as defined by the International Labour Office.14 Again this must be done with due consideration; too heavy a hand may be to the detriment of trade in the region, which will impoverish these areas further. This pressure can only come from the purchasers of these instruments; in a financially competitive sector it is only the potential loss of income that can effect realistic policy change.

Increasingly people in the developed world consider ethical issues when they purchase groceries, clothing, and various other products. Yet we know relatively little of where and under what conditions medical commodities like surgical instruments are manufactured. The UK government has declared itself a key proponent of the EU framework for corporate social responsibility,15 and within this context the NHS Purchasing and Supply Agency has developed a sustainable development policy.16 The stated aims of this policy include encouraging NHS suppliers to ensure compliance with international labour standards and to act in an ethical business manner. Yet at present the health service is not meeting such obligations; there is no systematic assessment of the origin of the products it uses or the conditions under which they were produced. It is time to insist on fair and ethical trade.

Contributor and sources: MB has an interest in global health and medical ethics and has ancestral roots in Sialkot, Pakistan. He visited the region in summer 2005 and was invited to see the linkages between Germany and Pakistan. He subsequently undertook both literature based and interview based research into this topic (much of his information was from personal communication with workers in Pakistan, who wished to remain anonymous). He has chaired a workshop at the 2006 Medisin Global Health Conference investigating the ethics of global trade in medical commodities. Funding: None. Competing interests: None declared.

Summary points

Many surgical instruments are manufactured in the developing world, particularly Sialkot in Pakistan

Labourers involved in manufacture earn poor wages, have poor health and safety standards, and include child workers

Suppliers of surgical instruments in the developed world may abuse their position to drive down prices in the developing world and stipulate unreasonable contractual obligations

There is a need for fair and ethical trade in the manufacture of medical commodities, and for the end users of these commodities to press for these changes

Corrections and clarifications

What social marketing can do for you

The wrong Washington crept into the author affiliation in this article by W Douglas Evans (BMJ 2006;332:1207-10, 20 May). After the author had seen the proofs we added the state initials WA, whereas in fact he hails from the other side of the United States, Washington DC.

Cover picture

We failed to credit the art work on the cover of the 1 July issue to Susie Freeman. The work was a detail from an installation (at the British Museum, London) that was put together by Susie Freeman, David Critchley, and Liz Lee.

BMJ’s claim of unemployment among junior doctors is rejected

In this news article by Caroline White (BMJ 2006;332:1471-24 Jun, doi: 10.1136/bmj.332.7536).1471-c) we said that the NHS Confederation questioned the BMJ’s claim that a shortage of training posts will prompt a mass exodus of junior doctors from the NHS. In fact, it was NHS Employers, a part of the NHS Confederation, that questioned the claim.
